NOTICE OF ALLOWANCE

The previous rejection of claim 19 under **35 U.S.C. §112, 2nd paragraph**, claims 5-21 under **35 U.S.C. §103(a)** as being unpatentable over Robinson ("Fermented Meat Products" in Encyclopedia of Food Microbiology) in view of Shankman et al. ("Vitamin Requirements of Twenty-three Lactic Acid Bacteria") and Snell ("The Nutritional Requirements of the Lactic Acid Bacteria and Their Application to Biochemical Research") and claims 5-21 under **35 U.S.C. §103(a)** as being unpatentable over Robinson ("Fermented Meat Products" in Encyclopedia of Food Microbiology) in view of Henry et al. ("Nutrition Handbook for Food Processers – Section 8.6-Nutritional enhancement versus food fortification.") and Rader ("Folic Acid Fortification, Folate Status, and Plasma Homocysteine") and further as evidenced by Kerry et al. ("Quality control of fermented meat products" in Meat Processing-Improving Quality has been withdrawn in light of Applicants' amendments and arguments filed 25 January 2011.

Claims 5-21 are allowed.

REASONS FOR ALLOWANCE

The following is an examiner's statement of reasons for allowance:

The prior art of record fails to teach the claimed method of accelerating the microbiological maturing process in making raw sausage comprising adding to comminuted raw sausage meat about 4 mg to about 25 mg per kilogram of raw sausage meat at least one material selected from the group consisting of folic acid and folate.

The prior art of **Robinson** ("Fermented Meat Products" in Encyclopedia of Food Microbiology) discloses a method of making a semi-dry sausage, comprising the steps of providing minced beef, pork and pork fat, mixing the minced meat with additives including pepper, garlic, sugar, and cardamom, stuffing the mixture into natural or artificial casings, and storing the sausage for 9-23 days at a relative humidity of 58 - 95% and a temperature of 12-30° C (p. 744/Manufacture of Fermented Sausages/P1, p. 747/Table 1/Dry Sausage).

Robinson does not disclose adding from about 4 mg to about 25 mg per kilogram of meat a material selected from the group consisting of folic acid and folate.

Shankman et al. teach that folic acid is known to be stimulatory or essential for growth of lactic acid bacteria such as *L. delbrückii* and *L. casei* (p.29/Table III). **Snell** teaches that lactic acid bacteria require complex media for rapid growth including folic acid (p.373/L1-3, p. 378/Table 2). **Snell** teaches that folic acid is a vitamin for lactic acid bacteria (p. 380/L16-17).

Shankman et al. and Snell do not teach how much of each media component, including folic acid, is required for rapid growth or maturation, i.e. fermentation.

While **Shankman et al. and Snell** teach folic acid is known to be stimulatory or essential for growth of lactic acid bacteria in culture, these references do not provide motivation for adding folic acid or folate to raw sausage meat wherein no starter cultures are added in the process (see claim 21). Moreover, **Shankman et al. and Snell** do not teach or suggest the addition of about 4 mg to about 25 mg of folic acid per kilogram of raw sausage. **Snell** teaches that only 5 micrograms of folic acid per liter of growth medium are required for supplementing for lactic acid bacteria growth. There is no motivation to add 10 to 50 times the recommended supplement.

In the alternative, **Rader** teaches that folic acid is a known nutritive additive in foods (Abstract). **Rader** teaches that folic acid fortification of food is intended to increase intake of folic acid among humans and reduce the risk of a pregnancy affected by a neural tube birth defect (NTD) and vascular disease (Abstract). **Rader** teaches that the addition of folic acid to enriched cereal-grain products became mandatory in the U.S. on January 1, 1998 at a level of 140 µg folic acid/100 g cereal-grain product (p. 2466S/Introduction).

Henry et al. teach that folates have the effect of reducing the levels of plasma homocysteine (p.202/Section 8.6/lines 10-11). **Henry et al.** teach that increased plasma homocysteine levels are a risk factor for cardiovascular disease and stroke (p.202/Section 8.6, lines 10-13). Further, **Henry et al.** teach that to achieve the ideal level of plasma homocysteine, dietary levels of folate would have to increase from the current average of 200 µg/day to 600 µg/day (p.203/Section 8.6/line 11).

While **Henry et al.** teach that dietary levels of folate should be 600 µg/day, Henry et al. does not recognize that folic acid or folate added to a raw sausage meat mixture would decrease during the maturing process, so that the amounts recommended by **Henry et al.** would not be achieved in the final product.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
